2025 B+ tree implementation assignment

Course name: Database Systems (ITE2038)

Professor: Sang-Wook Kim (email: wook@hanyang.ac.kr)

TAs: Seongeun Ryu (email: ryuseong@agape.hanyang.ac.kr)
Jeong-Min Park (email: jmpark96@agape.hanyang.ac.kr)
Dong-Hyuk Seo (email: hyuk125@agape.hanyang.ac.kr)

1. Assignment Title

• Implementation of a B+ tree index

2. Environment

- OS: Windows or mac os
- Language: Java or Python (any version is ok)
 - C++ language is also allowed, but not recommended

3. Constraints - Overall

- The B+ tree index should be stored in a single file (index file)
- The file contains all the meta information for the index and the index nodes
- The internal organization of the file is not considered in grading
- The program should provide following functions:
 - Search
 - ✓ A single key search AND a range search
 - Insertion of a key
 - Deletion of a key
 - ✓ The deleted entry should be completely removed from the index and the file
- Assumption
 - Keys and values are all in the integer type
 - Duplicated keys are not allowed for insertions
 - The keys in a node are stored in an ASCENDING order
- POLICY on COPY DO NOT COPY someone else's program
 - DO NOT USE functions/methods/routines from existing code/library/programs in pre-implemented B+ tree indexes or any other similar tree-based indexes
 - All these actions are regarded as COPY and so will be handled accordingly

4. Constraints - Internal Structure

- Each node of a B+ tree index should contain the following data inside:
 - Non-leaf node

 - ✓ p: an array of < key, left_child_node > pairs
 - r. a pointer to the rightmost child node
 - Leaf node

 - ✓ p_: an array of < key, value(or pointer to the value) > pairs
 - ✓ r. a pointer to the right sibling node

5. Constraints - Interface

- The program should support command-line interface

e follo	owing commands should be implemented:
Dat	ta File Creation
~	Command: program -c index_file b
	□ <i>program</i> : name of the program (bptree)
	☐ index_file: name of a new index file
	□ b: size of each node (max. # of child nodes)
•	This command creates a new index file containing an empty index with node size \boldsymbol{b}
	☐ If the file already exists, it is overwritten
~	Example
	□ java bptree -c index.dat 8
Ins	ertion
~	Command: program -i index_file data_file
	data_file: name of the input data file that has a number of key-value pairs to be inserted
•	This command inserts all the key-value pairs inside the data_file into the index in the index_file
	☐ The insertion causes the modification of the index file
	□ Insertions are performed in the same order of key-value pairs in the data file
~	The data file is provided as a .csv file (Comma Separated Values)
	 □ Each line of the data file contains a key-value pair • <key>,<value>\n</value></key>
	Data file example (input.csv) 53,3358290 16,6334568 63,128174 91,2455794 38,999283 81,3386744 99,28612 55,9139826 1,7697582 61,3415875
/	Example
	□ java bptree -i index.dat input.csv
	letion
	Command: program -d index_file data_file
	□ data_file: name of the input data file that has a number of keys to be deleted
•	This command deletes all the key-value pairs inside the input data file from the index
	☐ The deletion causes the modification of the index file
	□ Deletions are performed in the same order of keys in the data file

✓ The input data file is provided as a .csv file (Comma Separated Values)

□ Each line of the data file contains only a key value

<key>\n</key>
□ Deletion file example (delete.csv)
63
99
1
53
91
✓ Example
□ java bptree -d index.dat delete.csv
Single Key Search
■ Command: program -s index_file key
✓ key: key value to be searched
■ This command returns a value of a pointer to a record with the key
 Output format
✓ Print output to the stdout
While searching, the program prints each non-leaf node in the path that the search passes through
□ Print all the keys in the node in a single line
□ <key1>,<key2>,,<keym>\n</keym></key2></key1>
✓ When the search reaches the leaf node having the search key, print the value
matched with the search key
<pre></pre>
☐ If not found, print 'NOT FOUND'
✓ Example (This is not the same dataset as above example.)
java bptree -s index.dat 125
>java bptree -s index.dat 125
54,356
67,98
65462
Ranged Search
■ Command: program -r index_file start_key end_key
✓ start_key: lower bound of the range search
end_key: upper bound of the ranged search
■ This command returns the values of pointers to records having the keys within the range
provided — Output format
Output format Print output to the addout.
 ✓ Print output to the <i>stdout</i> ✓ Print all the key-value pairs with the key between <i>start_key</i> and <i>end_key</i> (including)
start_key and end_key)
<pre> <key1>,<value1>\n<key2>,<value2>\n </value2></key2></value1></key1></pre>
✓ Note that <i>start_key</i> and <i>end_key</i> may not be in the index
☐ The program prints only the key-value pairs between them
■ Example

✓ java bptree -r index.dat 100 200

```
>java bptree -r index.dat 100 200
125,65462
169,3728
193,98732
200,164260
```

6. How to turn in

- (1) Write your program
- (2) Write a document (pdf file) that contains:
 - Summary of your algorithm
 - Detailed description of your codes (for each function)
 - Instructions for compiling your source codes at TA's computer (e.g. screenshot)
 (Important!!)
 - You MUST SUBMIT instructions for compiling your source codes. If TAs read your instructions but cannot compile your program, you will get a penalty. Please, write the instructions carefully.
 - Any other specification of your implementation and testing
- (3) Put what you wrote in the submission folder named 'B+tree_Assignment_OOO'
 - Submissions should contain an executable file, all source files, and the document
 - If you use python, there is no need to contain an executable file.
 - The file structure is as follows
 - B+tree_Assignment\ Source\

{Your source files}.java/.py\ {Your executable file}.exe/.jar {Your document}.pdf

- (4) Push it to the LMS
 - Due date
 - Completed before 25 September: 100%
 - Completed before 2 October: 70%
 - After 2 October: 0%

You can ask questions about the assignment via Piazza(announced later) community. YOU WILL GET SERIOUS PENALTIES IF YOU DO COPY OR CHEAT

Good luck!
